Hop Production to Enhance Economic Opportunities for Ohio Farmers and Brewers

Brad Bergefurd, Extension Educator, Scioto County and Piketon Research & Extension Center, Ohio State University
Dr. Mary Margaret Gardiner, Associate Professor and Extension State Specialist, Department of Entomology, Ohio State University
Dr. Sally A. Miller, Professor and Extension State Specialist, Department of Plant Pathology, Ohio State University

Objective To screen hop cultivars for suitability, production performance and quality attributes under southern Ohio growing conditions.

Background
Crop Year: 2015
Location: Ohio Agricultural Research and Development Center (OARDC) Horticulture Research Unit 2. (lat.40° 47’ N; long. 81° 55’ W, Elevation 1020 ft).
County/Town: Wayne/Wooster
Soil Type: Doles Wooster Silt-Loam
Drainage: field tile, sub-surface and 10 inch raised beds
Previous Crop: Perennial Hops

Methods
Experimental design is Randomized Complete Block (RCB) with 4 replications of each treatment. Rhizomes were hand planted into 10 inch tall raised beds covered with black landscape fabric for weed and soil erosion control. Plants are spaced 3 feet apart in row and beds are spaced 12 foot on center. Drip irrigation is installed on top the landscape fabric. A high trellis training system (17 ft. tall) was installed and assembled after formation of the raised beds.
Insect control: Collected leaf samples were inspected weekly for the presence of two-spotted spider mite, hop aphid and the potato leaf hopper. Chemical control was used when the thresholds had been reached for each insect type.
Disease control: Plant samples were analyzed by the Plant Pathology lab, OARDC to evaluate for disease. Carla virus and Apple Mosaic virus was detected in Willamette Cv. samples. Fungicide applications were made on a 10 day schedule.
Irrigation: Drip irrigation was applied as needed throughout the growing season.
Fertilization: 5000 lb/acre CaCO3 was applied according to soil test results and incorporated before forming beds and applying landscape fabric. 125 lb/acre of Nitrogen fertilizer applications were made via fertigation through the drip irrigation system, over a six week period 4/15/15-6/10/15. Water soluble Nitrogen sources used were 12-48-8, 8-24-0 and 21-0-0.
Yield data: Hop cones were hand harvested as they reached physiological maturity according to chemical analysis results and fresh weight data collected. Hop cones were then dried to 8% moisture using a hop drying Oast (dryer), weighed, and air tight packaged with a vacuum sealer and immediately placed into a freezer at 10 degrees F.

- Treatments with the same letter are not significantly different.

Summary

Overall plant and hop cone quality was good. Wet pounds per acre ranged from a high of 3,505 (Cv. Columbus) to a low of 985 (Cv. Centennial). Wet pounds per plant ranged from a high of 2.89 pounds (Cv. Columbus) to a low of .81 pound (Cv. Centennial). Wet hop market prices average $25 per pound with gross return potential from Ohio hops in access of $70,000 per acre. Acreage estimates indicate 80 mature Ohio hop acres harvested in 2015.
